YouGov interviewed 2245 respondents who were then matched down to a sample of 2000 to produce the final dataset. The respondents were matched to a sampling frame of registered voters on gender, age, race, education, ideology, and political interest. The frame was constructed by stratified sampling from the full 2010 American Community Survey (ACS) sample with selection within strata by weighted sampling with replacements (using the person weights on the public use file). Data on voter registration status and turnout were matched to this frame using the November 2010 Current Population Survey. Data on interest in politics and party identification were then matched to this frame from the 2007 Pew Religious Life Survey. The matched cases were weighted to the sampling frame using propensity scores. The matched cases and the frame were combined and a logistic regression was estimated for inclusion in the frame. The propensity score function included age, gender, race/ethnicity, years of education, news interest, and ideology. The propensity scores were grouped into deciles of the estimated propensity score in the frame and post-stratified according to these deciles.

The respondents in the sample were matched against the voter registration files compiled by TargetSmart, and voter status and voter history was appended to the data. The final sample was post stratified to represent a population of 75% of respondents who are registered to vote but did not vote in either the 2010 or 2012 Primary Election, and 25% who did vote in at least one of the primaries. The final weights were trimmed at 7.
